What is Dev Proxy?

Dev Proxy is an API simulator that helps you effortlessly test your app beyond the happy path.

What is a proxy?

Use Cases

- Create API errors - on internal (ie. localhost) and external (ie. Microsoft Graph).
- Add latency and have the UI display loading data messages.
- Fire rate limits and handle throttling - does your app handle `Retry-After` header?

- Stand up mock APIs - for when the backend is not ready yet
- Intercept OpenAI-compatible requests to **analyze costs**
- Check if your API is making requests with least permissions with **API Center**

Get Started

Local Development

- ✓ Dev Proxy will set itself as the system proxy. You can run commands Invoke-WebRequest or curl.
- i Chromium based browsers (Edge/Chrome) bypass system proxy settings for localhost URLs - you need to exclude localhost URLs from the bypass list.

See [documentation](#) for more information and how to use with Firefox.

Run this -  save your work beforehand

```
taskkill /f /im msedge.exe  
cd "C:\Program Files (x86)\Microsoft\Edge\Application"  
msedge --proxy-bypass-list="<-loopback>" --proxy-server="127.0.0.1:8000"
```

Dev Proxy Toolkit

VSCode extension

Config

Open the VSCode command palette `CTRL+SHIFT+P` and 'Dev Proxy Toolkit: Create create configuration file'

Creates `.devproxy/devproxyc.json`

```
{
  "$schema": "https://raw.githubusercontent.com/dotnet/dev-proxy/main/schemas/v1.0.0/rc.schema.json",
  "plugins": [
    {
      "name": "RetryAfterPlugin",
      "enabled": true,
      "pluginPath": "~appFolder/plugins/DevProxy.Plugins.dll"
    },
    {
      "name": "GenericRandomErrorPlugin",
      "enabled": true,
      "pluginPath": "~appFolder/plugins/DevProxy.Plugins.dll",
      "configSection": "genericRandomErrorPlugin"
    }
  ],
  "urlsToWatch": [
    "https://jsonplaceholder.typicode.com/*"
  ],
  "genericRandomErrorPlugin": {
    "errorsFile": "devproxy-errors.json"
  },
  "rate": 50,
  "logLevel": "information",
  "newVersionNotification": "stable",
  "showSkipMessages": true,
  "showTimestamps": true
}
```

Running

```
req GET http://localhost:3000/meals
time 3/10/2025 1:45:24 AM +00:00
skip RetryAfterPlugin: Request not throttled
skip GenericRandomErrorPlugin: Pass through
oops LatencyPlugin: Delaying request for 420ms
pass Passed through
```

How does your application handle slow responses, rate limits and errors?

Plugins

- `Auth` - Simulates authentication and authorization using API keys or OAuth2.
- `CachingGuidancePlugin` - Shows a warning when Dev Proxy intercepted the same request within the specified period of time.
- `CrudApiPlugin` - Simulates a CRUD API with an in-memory data store.

- `EntraMockResponsePlugin` - Mocking auth flow API requests.
- `ExecutionSummaryPlugin` - Creates a summary of the requests that pass through the proxy.
- `MockGeneratorPlugin` - Generate mocks from the request.

- `MockRequestPlugin` - test webhooks in your client from dev proxy.
- `RateLimitingPlugin` - Simulates rate-limit behaviors.
- `RewritePlugin` - use rewrite rules - test example.com vs example.local
- `UrlDiscoveryPlugin` - creates a list of requested URLs.
- ... and much more

Mock

Return fixed data when your backend is not ready

- Different data on nth request
- Binary data
- Create a mock CRUD API
 - Access via `devtunnel` over the internet
 - Supports Microsoft Entra
